

Symm Forms

Symm Forms is a complete solution for creating, deploying and managing professional online forms.

Forms are essential for all businesses and Symm Forms provides the tools to create online forms for all types of business requirements including questionnaires, application forms, surveys and business processes.

Symm Forms is much more than just another form builder. It is a powerful solution incorporating a full content management system, a HTML page builder, an intelligent routing capability, a powerful expression builder and sophisticated data capture controls not found on basic solutions.

Symm Forms is targeted at business users and there is no dependence on specialist programming skills. Business professionals can create intelligent single or multi-page data entry forms that interact with the user and adapt to the data entered by the user.

With Symm Forms, the user can create complete public websites as well as Intranets and Extranets to provide personalised content.

Our services include:

- Building web portals
- Secure Intranet/Extranet applications
- Integration with legacy systems
- Application re-engineering and data migration

What we offer:

- We provide design, development and maintenance services.
- We adopt the development standards and methodology required by our clients.
- We provide a warranty and ongoing support.
- We undertake projects on a fixed price and T&M basis.

Features

Content management

Create complete websites with the powerful but easy to use HTML content editor. Create CSS driven templates and content blocks for a more professional site design. Other features include dynamic menus, news manager, links module, photo galleries and publications manager.

Useful controls

Create complex forms and incorporate controls like checkboxes, radio buttons, date pickers and list boxes as well as advanced controls like linked lists, row selectors, cell selectors and dynamic results.

Conditional Branching

Add intelligence to the forms by creating expressions to guide the user through the relevant pages based on the answers they provide.

Input Validations

Check entered data; enforce dependencies by creating validations and error messages. Provide help through tooltips and pop ups.

Calculations

Perform complex calculations using the built in maths functions. Build data matrices into the controls (e.g. list boxes, check boxes) to perform more complex rating calculations.

Dynamic Pages

Provide dynamism to pages by showing/hiding content based on responses provided or evaluating calculations as soon as the data is entered.

Emails

The email module allows a user to create email and document templates that will generate customised responses based on the answers provided on a form.

Emails can be generated automatically at any stage by defining the exact trigger conditions.

Document Generation

Generate Word and PDF documents based on pre defined templates by merging with the data submitted by the user.

Response Audit

A full audit capability records all form responses, page by page. The audit also lists all of the calculation results for verification purposes.

The required response data can also be exported to a spreadsheet for further analysis.

Design Flexibility

For a professional look, it is possible to create form/page templates with complete control over the look and feel through user defined style sheets. Templates provide consistency and eliminate repetitive tasks to speed up implementations.

It is also possible to create content blocks that can be maintained in one place and used in many different forms and pages.

Security

Symm Forms is built with comprehensive role based security features that make it ideal as an Intranet or Extranet application that can deliver personalised content to the logged in user.

Data Export

Xml based data export capability. Export selected response data to excel spreadsheets or external systems.

Symm Forms an intelligent solution for empowering the business user.
